

ABSTRACT

A dual strap load carrying apparatus. The first strap has two shoulder loops with a length extending between the first and second shoulder loops. The first strap attaches to a second strap which also has shoulder loops. An object to be carried is positioned on the straps above the point where the two straps connect to each other. The straps will ordinarily extend around the sides of objects to be carried and are secured on the shoulders of two users, who then have their hands free to steady the object while the weight of the object is borne on the shoulders through the shoulder straps. Bulky or odd-shaped loads are easily carried using the dual strap load carrying apparatus.
